Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP brosophila melanogaster BAC library was prepared by Kazutoyo Oscegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's PI and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPACR Resource Center can be

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Googawa and Aaron Mammoser in Pieter d Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-99 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's PI and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a vertebrate protein homologue of an UNC-3 protein of Genorhabditis elegans or a functional equivalent, derivative or bioprecursor of UNC-53. Also described: (1) a CDNA sequence encoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a nucleic acid which hybridises to the CDNA of (1); (3) vector comprising the CDNA as in (1); (4) a host cell containing the vector as in (3); (5) a transgenic cell, tissue or animal comprising the vector as in (3); (6)
                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                               9
facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the
                                                                                                                                                                                                                                                                             1 GACGGATCGGGAGATCTCCCGATCCCCTATGGTCGACTCTCAGTACAATCTGCTCTGATG

cell shape, motility, or the direction of cell migration for use as a cherapeutic; (7) a method for determination of whether a protein is an inhibitor or enhancer of regulation of cell behaviour, growth, shape or inhibitor or enhancer of regulation of cell behaviour, growth, shape or motility or the direction of migration by contacting a host cell captured by homologue of UNC-53 and determining a change of phenotype; (8) a method for identification of vertebrate homologues of C. elegans cuc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to a DNA library; and (9) a method for identification of a protein which is cative in the signal transduction pathway of a cell of which a vertebrate component comprising; (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an antibody/homologue complex; and (iii) analysing such a complex to identify any non-antibody protein bound to the complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling directionality of cell migration and cell shape in C. elegans. Vertebrate compless of UNC-53 can be used to promoce neuronal regeneration, revascularisation or wound healing, to treat chronic neurodegenerative sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

            selectively destroying native cells in a tissue of foctal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for cells replace destroyed cells of the tissue. The method is useful for mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the

The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present tanned the present invention but not mentioned further within the specification.

                                            This is the nucleotide sequence of pCTM, a plasmid which contains a CMV promoter, a tripartite adenovirus leader flanked by T7 and SP6 promoters, and a multiple cloning site with a bovine growth hormone polyA site and downstream SV40 polyA site. It has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and BZF transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the EZF promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

Plasmid pCTMI has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and E2F transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct os field.)

This is the nucleotide sequence of pCTMIE, a plasmid that was constructed by amplifying the SY40 enhancer from SY40 viral DNA by PCK, digesting the amplified broduct with BglII and insertino Bamil-digested plasmid pCTMIE with BglII and insertino Bamil-digested plasmid pCTMIE see AA440007). Plasmid pCTMIE has been used as a vector for the expression of fusion protein of the invention that comprise retinoplastoma protein (BP, see AA462465) and E2F transcription factor (see AA462464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, pspecifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New fusion polypeptide of, e.g. transcription factor - used to treat, e.g. hyper-proliferative disease such as cancer and restenosis.

This sequence represents the vector pVAC1. This vector is based on the commercially available vector pRc/RSV. Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSfi/Not.Tagl, was modified to replace the pelb leader with the human immunoglobulin VHI leader sequence that permits the encoding of an SfiI cloning site without modification of the amino acid sequence. This fragment was then cloned as an EcoRI/Blunt-HindIII fragment into NotI/Blunt- HindIII cut vector pRc/RSV to give pVACI. The single chain Fv for an individual patient can be inserted within the VHI leader sequence. This plasmid when encoding a single chain murine

```
The invention relates to a nucleic acid construct for delivery into living cells in vivo, to induce an immune response to a disease peptide antigen, where the construct directs expression of a fusion protein comprising the peptide antigen and the first domain of FrC. Also included are a nucleic acid vector comprising the above construct, a host cell comprising the above construct or vector and a method of producing a nucleic acid construct for inducing an immune response. The method comprises identifying a nucleic acid sequence encoding a disease peptide antigen comprising epitopes characteristic of the disease, cloning the nucleic acid sequence, introducing the cloned nucleic acid into a vector which allows the antigen to be expressed as a fusion with a first domain FrC from tetanus toxin, and optionally isolating the construct from the response, particularly to tumour antigens. The present sequence is vector puAc1 which encodes a vaccine of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel nucleic acid construct for inducing an immune response in vivo to an antigen, capable of directing the expression of a fusion protein that comprises an antigen and an adjuvant sequence derived from a plant viral coat protein. The construct of the invention has cytostatic and virucide activity. The nucleic acid construct is useful for inducing an immune response in a patient, for vaccinating a patient against an infectious disease caused by an antigen derived from a pathogen e.g. a virus, for treating a cancer patient or a patient with a predisposition to cancer and for treating a patient having a B cell malignancy, where the construct is encapsidated, and optionally, a second nucleic acid sequence encoding a further immunomodulatory which is acid sequence encoding a further immunomodulatory in medical treatment, and in the preparation of a vaccine for treating or preventing a disease state associated with the antigen. The sequence

The specification describes a microsphere comprising dihydrazide derivatised hyaluronic acid crosslinked to a nucleic acid (NA). The microspheres cause reduced inflammatory responses, and have increased safety and biodegradability. The microspheres are useful for transfecting a cell of a subject and for tracating subject having myocardial ischemia, by increasing cardiac angiogenesis. They are also useful for treating haemophilia. The present sequence represents the plasmid pCDNA3.1/Gs, into which is inserted a polynucleotide sequence which is crosslinked to hyaluronic acid. The polynucleotide sequence encodes a vascular endothelial growth factor (VEGF)

The invention provides a nucleic acid molecule (I) comprising at least the functional part of blasticidin resistance (BS) gene, or its homolog, linked through a recognition sequence to at least one selected gene. (I) is useful in treatment comprising: (I) providing cells/tissues transfected with (I); (2) surgical administration of the cells/tissues to the patient to be treated; and optionally (3) monitoring the status of the cells/tissues by the patient. Therapeutic compositions comprising cells/tissues transformed with (I) is useful in identifying the role of genes in healthy and diseased tissue, in tissue engineering and in cosmetic surgery. Tissue engineering can be used to treat arthritis, joint replacement, skin grafts for burn victims, and replacement coronary arteries. Cosmetic tissue surgery includes rhinoplasty. The present sequence represents the nucleotide sequence of the vector pIRES/BS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     fusion protein; amyloid precursor protein; APP; transcription factor; notocropic; neuroprotective; APP inhibitor; amyloid precursor protein inhibitor; Alzheimer's disease; beta-secretase; gamma-secretase; human; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a recombinant vector which comprises DNA, consisting of an insertion cassette contained between at least two insertion sites, that encodes a small nuclear (sn) RNA. The invention is used to identify snRNA modifications that inhibit expression of transcription products (and the identified snRNA are used to suppress expression) for delivering antisense sequences to the nucleus and to create transgenic animals. The present DNA sequence is human snRNA, Ul
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

DNA encoding a fusion protein of amyloid precursor protein, useful in screening for anti-Alzheimer agents, comprises a fused transcription

Disclosure; Fig 32B-F; 193pp; English.

The present invention describes a DNA molecule (I) that encodes a fusion protein (FP) comprising: (i) an amino acid sequence of amyloid precursor protein (APP), either the wild type, Swedish or NFEV versions; and (ii) a transcription factor (TF), fused in frame to the C-terminus of (i). Also described: (I) an expression vector containing (I); (2) a eukaryotic cell containing (I); and (3) methods for identifying a compound (A) that chibits processing of APP, using the cells of (2). (I) has nootropic and neuroprotective activities. (I) can be used to produce eukaryotic cells that express FP and are useful in screening for agents that inhibit processing of APP. The agents are potentially useful for the treatment or processing of APP. The agents are potentially useful for the treatment or inhibitors of: (a) beta- and gamma-secretases; and (b) cytoplasmic/extracellular APP signaling in a single assay. Cell-based assays may be free of interference from alpha-secretase activity and are homogeneous (no chromatography, immunoprecipitation or washing required) so well suited to high-throughput screening. The present invention.

DNA was purified from a crude nuclear prep using Brassica oleracea TO1000DH3 buds provided by Thosmas Osborn at the University of Wisconsin. Genomic DNA was provided by Pablo Rabinowicz (CSHL) and the shotgun library prepared at Washington University Genome Sequencing Center."

site_2: Not1; About 1 week after bolting, cDNA synthesis
susing SuperscriptThm-system (Invitrogen) with an
oligo(dT)-primer containing Not1 restriction site and a
Sall adapter. The main library (plate numbers begin with
1) of 38,000 clones was rearrayed into the sublibrary
(plate numbers begin with 201) containing 5,000 putative
expression clones. Average insert size is 1 kb. Note: The
rearrayed sublibrary (plate numbers begin with 201) was
sequenced. Library generation and sequencing was granted
in context of GABI-LAPP; data are also accessible at
https://gabi.rzpd.de"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   207jo4.pl AtMl Arabidopsis thaliana cDNA clone MPMGp2011J04207

Site 2: Not1; About 1 week after bolting, cDNA synthesis using SuperscriptTW-system (Invitrogen) with an oligo(dT)-primer containing Not1 restriction site and a Sal1 adapter. The main library (plate numbers begin with 1) of 38.000 clones was rearrayed into the sublibrary (plate numbers begin with 201) containing 5.00 putative expression clones. Average insert size is 1 kb. Note: The rearrayed sublibrary (plate numbers begin with 201) was sequenced. Library generation and sequencing was granted in context of GABI-LAPP; data are also accessible at https://gabi.rzpd.de"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 $. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/BST Resource Center (www.genome.clemson.edu)."
